

Exchange 2007 POP3 setup Parameters

The key points to understand in this particular configuration are:

- POP3 connections will require SSL and use port 995.
- IMAP connections will require SSL and use port 993.
- SMTP connections will require authentication and use TLS on port 587.
- The client must trust the certificate used to secure these connections.

If you are not using a trusted 3rd party certificate, you must use the certificate distribution package to install the SBS CA certificate on the client.

- Make sure you port-forward (pinhole) the above ports through your firewall with the SBS server's internal IP address as the destination.

When setting up the account login name, use only the actual user name, not a complete username and domain as in other common email account settings.
