

Small Business Server Migration stops with errors relating to trust relationships with other domains, lack of access to the Schema because of membership status in Domain Administrators, Enterprise Administrators, Schema Administrators groups.

The answer is to edit the setup.sdb file found in the c:\documents and Settings\administrator.local\local settings\temp\sit*****.tmp. There may be several of these sit folders. Choose the one with the latest creation date.

Search for the keyword relating to the error condition (admin). Place a semi-colon at the front of the line it occurs in, this will cause the setup program to skip this line. Save the file and rerun the SBS setup program.
